

# Summary Document

In order to comply with the requirements of this project, my website included the following items: a header and footer that is consistent across all pages, three pages of contents and a home page, and the header includes links to all of these pages.

For interaction on the website, I decided to create most of it myself, however to meet the requirements I also included two jQuery plugins. The first of which is a lightbox plugin that can be seen by clicking on any of the images on the Work or Team page. The second plugin is one that automatically resizes the textarea on the contact page to fit the users content. Along with those two plugins there is a jQuery UI widget, a select widget, on the contact page.

My website also includes two different ajax requests. The first one is on the team page, where it loads a json file to list all of the members of our company. The second one is when you submit the form on the contact page.

Overall for our peer evaluations, most of the feedback I received was to add more content to the website and other small details like indicating what the page the user is on. All of which I updated accordingly.

I believe the website I created will be great for the company and our customers. For the future the site is incredibly easy to update the content and layout of the page. If we ever need more than that the website is built in such a way that it would be easy to remove the jQuery dependency and drop a more modern framework like React or Angular.

## Accessibility:

- Inputs have a link to their labels, via the label type and the aria-labelledby attribute
- Input have the aria-required attribute when they are required
- The icon links in the footer have the correct name in the aria-label attribute
- In the header the links are marked active by the aria-selected attribute
- All of the images have a correct alt attribute
